

Data Science Imposters Podcast

Description

This is a review of a podcast called “Data Science Imposters Podcast: ‘Data Science’ is an evolution. What does it mean now in the Workplace/ w/ Erin Stanton.”

Something I learned

- Data Science is a team sport - it is helpful to have programmers, statisticians, and subject matter experts all on a team to make sense of data.
- Data Storytelling is the next evolution of Data Visualization.
- Nobody knows everything in Data Science - Be humble and curious.

Connection to INFO 511

- One recommendation from the podcast is ‘just get started’ - Stanton talked about accessing her Spotify data to see if she could build a recommendation model. Spending time trying out building things instead of just doing tutorial after tutorial is critical to building real world skills. I am already thinking some projects to automate data collection and analysis in my Psychiatric practice.
- Stanton talked about her final project from her master’s of Data Science at UC Berkeley - using longitudinal data of privacy policies from 141 websites over 20 years. The data was gathered from Google’s ‘Way Back Machine.’ - I didn’t know that was a thing, but could be very helpful.
- Stanton talked at length about going from the workplace, back to school, and how her professional confidence grew as she came to realize that nobody would ever know everything. It set her free. I appreciate this point of view as this discipline can be intimidating.
